

## **Repellent mechanisms of mosquitos-the bracelet way**

Mosquitos are one of the most feared and infamous insect of the whole worlds as it is associated in transmitting some of the deadly diseases throughout the world. Be it malaria, west Nile viruses or EEE, all had as well as still taking a toll not only humans but also other species like dogs and horses to name a few . Their effective control is to make clear surroundings with proper hygiene, which is not always possible for various reasons and measures. So to protect from these insects a lots of repellents has been used, which are chemicals as well as organic in their nature. Indoor environments, peoples protect themselves by using repellents or providing nets to prevent their entry in the household. But the problems arise when one goes out for their various needs.

To protect themselves in such conditions, lots of repellent creams are available which are sticky and uncomfortable for a longer use. To prevent such uncomfortable situations, a lot of inventions have been taking place for a hassle free and safe environment for people. One such approach is the use of [mosquito bracelet](#). Though there a lots of companies offering their products with various specifications, the ideal mosquito bracelet is that which use organic products as their active ingredients than other popular chemical counter parts. As they are lots of concerns in using chemical based products because of various environment concerns, this organic method of mosquito repulsions is gaining its acceptances throughout the world.

These bracelets are very easy to use, just wear it while going outsides and puncture the storage tin which held the organic ingredients. Though most of the manufacturing companies of these bracelets previously use chemical ingredients like DEET, they are now replaced by citronella oil as it is environment friendly and effective to prevent mosquitos bite. Citronella oil has been used as an effective repellent which by the virtue of its strong odor masks the mosquito's receptors without harming them. So individuals are in a state of invisibility for those predators which uses their receptors to track their hosts for a blood meal. [Mosquito bracelets](#) are water resistant which give them an added advantage, though some reports claim their reduced effectiveness in water. Most of the manufacturing industries related to this repellent bracelet come with various unique way of marketing their products for using it in a daily basis. But one word of concern that people should value these product's effectiveness as different reports offer different opinions about their effectiveness as well as their authentications and reliability as an effective repellent mechanisms for the society.
